# The Vaccine Lottery - a 1000 fold variation in batch toxicity

# by Craig Paardekooper

# Severe Reactions to the Vaccine

The VAERS database contains records of adverse reactions following administration of the Covid 19 vaccinations.

A significant number of adverse reactions have been reported - for example -

- Deaths
- Disabling
- Hospitalisations

Curiously though, the majority of people taking the vaccines do not experience any significant adverse reactions.

Why do some people experience very severe reactions, whilst the majority experience hardly any reaction at all?

# A Hypothesis

An explanation was suggested that perhaps the vaccine batches are not all equal – that there may be significant variation in toxicity between different batches.

# Testing the Hypothesis

In order to test this explanation, I downloaded the VAERS database in its entirety, and opened it in Microsoft Excel – and created a pivot table. I counted –

- the total number of adverse reactions for each separate batch number.
- the number of adverse reactions in each State for each separate batch number

I wanted to see if any batches stood out as more toxic than others.

# The Results

The total number of adverse reactions recorded in VAERS is 456,922.

The total number of vaccine batches recorded in VAERS is 28,330.

# 1. Number of harmless batches

95% of the batches (27004 of the batches) each produced 10 or fewer adverse reactions. So you could literally count the adverse reactions for each batch on your 2 hands. So 95% of the batches were relatively harmless.

In fact 68% of all batches **only produced a single adverse reaction for each batch** – so you could actually count the number of adverse reactions for each batch on 1 finger.

95% of all of the batches were responsible for just 10% of the adverse reaction reports (46,386 out of 456,922). [See Appendix A for more details.]

# 2. Number of toxic batches

In stark contrast, the toxic batches have up to 5000 times the level of toxicity, and produce up to 5000 times the number of adverse reaction reports.

# [These toxic batches are listed below in Appendix B - with the batch number in column 1 and the number of adverse reaction reports in column 2.]

The 184 most toxic batches (a mere 0.65% of the total number of batches) produced 1000 to 5000 adverse reaction reports each – which means that they are about 1000-5000 times more toxic than the harmless batches.

These 184 batches are responsible for 70% of all the adverse reaction reports, and 70% of all the recorded deaths in the VAERS database.

These 184 batches cause adverse effects, deaths and disabilities **in every single state across the whole of the US** – **where ever they are deployed**. They consistently cause injury - leaving a heavy trail of death and disability in their wake.

There is a 1 in 200 chance that your shot will come from one of these toxic batches - because these toxic batches comprise 0.65% of all the batches deployed.

#### Video

I have created a video showing all this. In the video (<u>https://www.youtube.com/watch?v=0fCh4sgwi6g</u>) these toxic batches are visible as a line of high numbers stretching horizontally across the screen (this is because they produce many adverse reactions in every state). [See Fig. 1]

#### Conclusion

The hypothesis is found to be true, that -

- 95% of the vaccine batches are relatively harmless and account for only 10% of the adverse reaction reports, and 10% of deaths
- 5% of the vaccine batches are more toxic and account for 90% of the adverse reaction reports, and 90% of the deaths following vaccination
- 0.65% of the vaccine batches are 1000-5000 times more toxic and account for 70% of the adverse reaction reports and 70% of the deaths following vaccination.

#### Discussion

#### Cause of Adverse Reactions - Vaccine or Comorbidities?

The fact that specific batches consistently produce adverse reactions across all States is strong evidence that these reactions are caused by the batches rather than by the individual health status of the recipients.

The same batches that are associated with high numbers of deaths, are also associated with high numbers of disabilities in other people - indicating that the batches are the causal agent of both. [See Fig. 2]

#### Why are some batches 1000 times more toxic than other batches?

The much higher toxicity of the worst batches indicates either that

• Ingredients added : more dangerous ingredients may have been added to the batches,

or that

• **Concentration increased** : the concentration of ingredients has been increased to above the lethal dose (perhaps Pharma is trying to establish the LD50 or therapeutic limits)

or both.

In contrast, the negligible or very low toxicity of the majority of the batches (68% produce only a single reaction report) may indicate that these batches are simply **placebos**, i.e. the control group, and may consist of **just saline**.

The Govt should be made aware of this, since they are paying a high price for what amounts to a couple of ml of salt water.

# Is the Government causing harm intentionally?

The Government has certainly failed to inform recipients of the high danger posed by 1 in 200 of the batches, so people are not being provided with the opportunity for informed consent.

In addition to this, the Govt -

- has not attempted to recall these toxic batches
- engages in increased censorship via mainstream media and social media
- applies increased coercion to be silent
- applies increased coercion to take a vaccine, some batches of which are very toxic

The Government may also be giving members of the public a false sense of security, since a large % (more than 70%) appear to be inert, harmless placebos with no active ingredients.

#### Fig 1 – Showing how a toxic batch stands out from the background of harmless batches.

Far left column = Batch number Far right column = Total number of adverse reaction reports for that batch Columns in between = Number of adverse reactions in each state of the USA

# Fig 2. Those batches associated with high number of deaths in some people, are also associated with high number of disabilities in other people.

What's-more, the number of disabilities is directly proportional to the number of deaths.

This is strong evidence that batches are the causal agent rather than comorbidities, old age or personal health issues of the vaccinated.

#### Appendix A

Analysis of batches that produce 10 or fewer adverse reaction reports The total number of batches of vaccine deployed in the USA is 28,330 90% of all batches produce 5 or fewer adverse reaction reports 80% of all batches produce 2 or fewer adverse reaction reports 70% of all batches produce only a single adverse reaction report

In total 95% of the batches are relatively harmless – accounting for only 10% of the adverse reaction reports.

68% of the batches (19286 of the batches) each produced only 1 adverse reaction report 12.5% of the batches (3542 of the batches) each produced only 2 adverse reaction reports 5.5% of the batches (1548 of the batches) each produced only 3 adverse reaction reports 3% of the batches (826 of the batches) each produced only 4 adverse reaction reports 2% of the batches (543 of the batches) each produced only 5 adverse reaction reports 1.4% of the batches (396 of the batches) each produced only 6 adverse reaction reports 1.2% of the batches (341 of the batches) each produced only 7 adverse reaction reports 0.7% of the batches (210 of the batches) each produced only 8 adverse reaction reports 0.6% of the batches (174 of the batches) each produced only 9 adverse reaction reports

# Appendix B

The top 0.65% of batches - the most dangerous batches – these batches account for 70% of all adverse reaction reports, and 70% of all deaths following vaccination.
